# Primal and Dual $(n, k)$ -problem

Suppose  $X_1, X_2, \dots, X_n$  are topological spaces with  $\sigma$ -algebras  $\mathcal{B}_1, \mathcal{B}_2, \dots, \mathcal{B}_n$  respectively.

Let  $Pr_{X_{i_1} \times \dots \times X_{i_k}}, Pr_I$  be the projection operator from  $X = X_1 \times \dots \times X_n$  to the coordinate  $k$ -dimensional subspace  $X_{i_1} \times \dots \times X_{i_k}$ .

$$\mathcal{I}_k = \{(i_1, i_2, \dots, i_k) \mid 1 \leq i_1 < i_2 < \dots < i_k \leq n\}.$$

For any multi-index  $I = (i_1, \dots, i_k) \in \mathcal{I}_k$  there is given a measure  $\mu_I$  on the space  $X_{i_1} \times \dots \times X_{i_k}$ .

$$\mathcal{P}_\mu = \{\mu \mid Pr_I \mu = \mu_I \text{ for any } I \in \mathcal{I}_k\}$$

Also, assume  $c : X \rightarrow \mathbb{R} \cup \{+\infty\}$  is a cost function.

# Primal and Dual $(n, k)$ -problem

## Definition

Primal  $(n, k)$ -problem is a problem of minimization of the functional

$$P(\pi) = \int_X c(x_1, \dots, x_n) d\pi$$

over  $\pi \in \mathcal{P}_\mu$ .

## Definition

Dual  $(n, k)$ -problem is a problem of maximization of the functional

$$D(\{f_l\}) = \sum_{l \in \mathcal{I}_k} \int f_l(x_{i_1}, \dots, x_{i_k}) d\mu_l$$

over (integrable) functions  $\{f_l\}$  such that  $\sum_l f_l(x_{i_1}, \dots, x_{i_k}) \leq c(x_1, \dots, x_n)$ .

## Theorem (Duality)

Suppose  $X_i$  are compact metric spaces,  $c \geq 0$  is a continuous cost function. Then the following equality holds:

$$\min_{\mu \in \mathcal{P}_\mu} I[\mu] = \sup_{f_l \in L^1(\mu_l)} \sum_{l \in \mathcal{I}_k} \int f_l(x_{i_1}, x_{i_2}, \dots, x_{i_k}) d\mu_l.$$

Here one takes supremum over functions  $f_l$  such that

$$\sum_l f_l(x_{i_1}, x_{i_2}, \dots, x_{i_k}) \leq c(x_1, \dots, x_n)$$

for all  $(x_1, \dots, x_n) \in X$ .

Duality theorem is proved in [G, Z, Kolesnikov, 2018] using the technique from [Villani, 2003]. The proof uses the following theorem:

## Theorem (Fenchel-Rockafellar duality)

*Let  $E$  be a normed vector space and  $E^*$  be the corresponding topologically dual space. Consider convex functionals  $\Phi, \Psi$  on  $E$  with values in  $\mathbb{R} \cup \{+\infty\}$ . Let  $\Phi^*, \Psi^*$  be their Legendre transforms. Assume that there exists a point  $z \in E$  satisfying  $\Phi(z) < +\infty$ ,  $\Psi(z) < +\infty$  and  $\Phi$  is continuous at  $z$ . Then*

$$\inf(\Phi + \Psi) = \max(-\Phi^*(-z^*) - \Psi^*(z^*))$$

# Prove of duality

Assume  $E$  is a space of continuous functions on  $X$ . By the Riesz-Markov-Kakutani representation theorem  $E^*$  is the space of finite signed measures on  $X$ .

$$\Phi(u) = \begin{cases} 0 & \text{if } u \geq -c, \\ +\infty & \text{else.} \end{cases} \quad \Psi(u) = \begin{cases} \sum_{I \in \mathcal{I}_k} \int f_I d\mu_I & \text{if } u = \sum_I f_I, \\ +\infty & \text{else.} \end{cases}$$

$$\inf(\Phi(u) + \Psi(u)) = - \sup_{\sum_I f_I \leq c} \sum_I \int f_I d\mu_I$$

After Legendre transformation one obtains:

$$\Phi^*(-\pi) = \begin{cases} \int c d\pi, & \text{if } \pi \geq 0, \\ +\infty, & \text{else.} \end{cases} \quad \Psi^*(\pi) = \begin{cases} 0, & \text{if } \pi \in \mathcal{P}_\mu, \\ +\infty, & \text{else.} \end{cases}$$

Therefore  $\max(-\Phi^*(-z^*) - \Psi^*(z^*)) = - \min_{\pi \in \mathcal{P}_\mu} \int c d\pi$ .

# The following plan

- Under which assumptions there exists at least one measure with given projections?
- Under which assumptions there exist dual solutions?
- Is dual solution bounded? Is it continuous?

# Existence of a uniting measure

## Definition

**Uniting measures** – measures in  $\mathcal{P}_\mu$ .

Unlike classical Monge-Kantorovich problem the set of measures with needed projections can be empty.

## Proposition (Weak sufficient condition)

*The set  $\mathcal{P}_\mu$  is non-empty (there exist uniting measures) if  $\mu_I = \mu_{i_1} \times \cdots \times \mu_{i_k}$ ,  $I = (i_1, \dots, i_k) \in \mathcal{I}_k$  for some probability measures  $\mu_1, \dots, \mu_n$  on respective spaces  $X_1, \dots, X_n$ .*

## Proposition (Weak necessary condition)

*Suppose  $\mathcal{P}_\mu$  is non-empty; then for any  $I, J \in \mathcal{I}_k$  there holds*

$$Pr_{I \cap J} \mu_I = Pr_{I \cap J} \mu_J$$

# Existence of a uniting measure

Weak necessary condition is not sufficient. Suppose  $X = Y = Z = \{0, 1\}$ . Define measures on  $X \times Y$ ,  $X \times Z$  and  $Y \times Z$

$\mu_{xy}$

$\mu_{xz}$

$\mu_{yz}$

There is no uniting measure for  $\mu_{xy}$ ,  $\mu_{xz}$  and  $\mu_{yz}$  but there exists uniting signed measure.

## Notation for $(3, 2)$ -problem

Suppose  $X, Y, Z$  are some measurable spaces; assume  $\mu_{xy}, \mu_{xz}, \mu_{yz}$  are finite measures on  $X \times Y, Y \times Z, X \times Z$ . For the existence of a measure  $\mu$  on  $X \times Y \times Z$  with projections  $\mu_{xy}, \mu_{xz}, \mu_{yz}$  the following equalities must hold:

$$Pr_X \mu_{xy} = Pr_X \mu_{xz} = \mu_x,$$

$$Pr_Y \mu_{xy} = Pr_Y \mu_{yz} = \mu_y,$$

$$Pr_Z \mu_{xz} = Pr_Z \mu_{yz} = \mu_z.$$

Also let  $\nu_x, \nu_y, \nu_z$  be arbitrary finite measures on  $X, Y, Z$ .

## Existence of a uniting measure in $(3, 2)$

We recall the existence of the uniting measure in case  $\mu_{xy} = \mu_x \times \mu_y$ ,  $\mu_{xz} = \mu_x \times \mu_z$ ,  $\mu_{yz} = \mu_y \times \mu_z$ . For example, there fits the measure  $\mu_x \times \mu_y \times \mu_z$ . The following theorem gives a generalization of this construction:

### Theorem (Density condition)

*Suppose  $X, Y, Z$  are spaces equipped with finite measures  $\nu_x, \nu_y, \nu_z$ . Suppose that  $\mu_{xy}, \mu_{xz}, \mu_{yz}$  are absolutely continuous with respect to  $\nu_x \times \nu_y, \nu_x \times \nu_z, \nu_y \times \nu_z$  respectively. Assume  $p_{xy}, p_{xz}, p_{yz}$  are the respective densities. If for  $\lambda \leq \frac{3}{2}$  there holds*

$$1 \leq p_{xy}, p_{xz}, p_{yz} \leq \lambda,$$

*then there exists a uniting measure for  $\mu_{xy}, \mu_{xz}$  and  $\mu_{yz}$ .*

## Existence of a uniting measure in $(3, 2)$

It's sufficient to prove the density condition theorem only for  $\lambda = \frac{3}{2}$ . Without loss of generality  $\nu_x, \nu_y, \nu_z$  are probability measures.

$$M = \mu_{xy}(X \times Y) = \mu_{xz}(X \times Z) = \mu_{yz}(Y \times Z),$$

Assume  $p_x, p_y, p_z$  are the densities of  $\mu_x, \mu_y, \mu_z$  with respect to  $\nu_x, \nu_y, \nu_z$ . There holds  $1 \leq p_x, p_y, p_z, M \leq \lambda$ .

For example, if  $M = \lambda$ , the following equalities hold:  $\mu_{xy} = \lambda(\nu_x \times \nu_y), \mu_{xz} = \lambda(\nu_x \times \nu_z), \mu_{yz} = \lambda(\nu_y \times \nu_z)$ . The measure  $\mu = \lambda(\nu_x \times \nu_y \times \nu_z)$  has projections  $\mu_{xy}, \mu_{xz}$  and  $\mu_{yz}$ . The same argument works for  $M = 1$ .

# Existence of a uniting measure in (3, 2)

The following signed measure is uniting

$$\begin{aligned}\mu &= \frac{4}{M^2} \mu_x \times \mu_y \times \mu_z - \\ &\quad - \frac{2}{M} (\nu_x \times \mu_y \times \mu_z + \mu_x \times \nu_y \times \mu_z + \mu_x \times \mu_y \times \nu_z) + \\ &\quad + 2(\mu_{xy} \times \nu_z + \mu_{xz} \times \nu_y + \mu_{yz} \times \nu_x) - \\ &\quad - \frac{1}{M} (\mu_{xy} \times \mu_z + \mu_{xz} \times \mu_y + \mu_{yz} \times \mu_x)\end{aligned}$$

since

$$\begin{aligned}Pr_{XY}\mu &= \frac{4}{M} \mu_x \times \mu_y - 2\nu_x \times \mu_y - 2\mu_x \times \nu_y - \frac{2}{M} \mu_x \times \mu_y + \\ &\quad + 2\mu_{xy} + 2\mu_x \nu_y + 2\nu_x \mu_y - \mu_{xy} - \frac{2}{M} \mu_x \times \mu_y = \mu_{xy}.\end{aligned}$$

# Existence of a uniting measure in $(3, 2)$

Check the non-negativity of this measure. To this end, check

$$\frac{4}{M^2}a_1b_1c_1 - \frac{2}{M}(a_1b_1 + a_1c_1 + b_1c_1) + 2(a_2 + b_2 + c_2) - \frac{1}{M}(a_1a_2 + b_1b_2 + c_1c_2) \geq 0$$

for  $1 \leq a_1, b_1, c_1, a_2, b_2, c_2, M \leq \frac{3}{2}$ . This expression is greater than  $\varepsilon(M) > 0$  for all  $a_1, b_1, c_1, a_2, b_2, c_2$ , and  $M \in (1, \frac{3}{2})$ .

## Proposition

*In the assumptions of the density condition there exists a uniting measure  $\mu$  absolutely continuous with respect to  $\nu_x \times \nu_y \times \nu_z$ ; the density of this measure is bounded and separated from zero.*

# Existence of a uniting measure

## Theorem

*For  $\lambda \leq 2$  there exists a (not necessary absolutely continuous) uniting measure  $\mu$ .*

For  $\lambda > 2$  this theorem fails.

Most of the results can be generalized to  $(n, k)$ –problem.

## Theorem

*Suppose  $\{\mu_I \mid I \in \mathcal{I}_k\}$  satisfy the weak necessary conditions. Then there exists a signed measure  $\mu$  such that*

$$Pr_I \mu = \mu_I, I \in \mathcal{I}_k.$$

There exists an analogue of density condition in  $(n, k)$ –problem for some  $\lambda_{n,k}$ .

## (3, 2)–function

### Definition

A function  $F : X \times Y \times Z \rightarrow \mathbb{R}$  is called a (3, 2)–function if there exist functions  $f_{xy}, f_{xz}, f_{yz}$  such that

$$F(x, y, z) = f_{xy}(x, y) + f_{xz}(x, z) + f_{yz}(y, z)$$

for any  $(x, y, z) \in X \times Y \times Z$ .

### Proposition

*F is a (3, 2)–function iff for any  $x_0, x_1 \in X, y_0, y_1 \in Y, z_0, z_1 \in Z$  there holds*

$$\begin{aligned} F(x_0, y_0, z_0) + F(x_1, y_1, z_0) + F(x_1, y_0, z_1) + F(x_0, y_1, z_1) = \\ = F(x_1, y_1, z_1) + F(x_1, y_0, z_0) + F(x_0, y_1, z_0) + F(x_0, y_0, z_1) \end{aligned}$$

# $(3, 2)$ -function

For any  $(3, 2)$ -function  $F$  the sum of the values in the red points equals the sum of the values in the blue points.

## $(3, 2)$ -function

One can construct  $f_{xy}, f_{xz}, f_{yz}$  using  $(3, 2)$ -function  $F$ .

### Proposition

Suppose  $F$  is a  $(3, 2)$ -function,  $(x_0, y_0, z_0)$  is an arbitrary point of  $X \times Y \times Z$ .

$$f_{xy}(x, y) = F(x, y, z_0) - \frac{1}{2}F(x, y_0, z_0) - \frac{1}{2}F(x_0, y, z_0) + \frac{1}{3}F(x_0, y_0, z_0),$$

$$f_{xz}(x, z) = F(x, y_0, z) - \frac{1}{2}F(x, y_0, z_0) - \frac{1}{2}F(x_0, y_0, z) + \frac{1}{3}F(x_0, y_0, z_0),$$

$$f_{yz}(y, z) = F(x_0, y, z) - \frac{1}{2}F(x_0, y_0, z) - \frac{1}{2}F(x_0, y, z_0) + \frac{1}{3}F(x_0, y_0, z_0).$$

Then  $F(x, y, z) = f_{xy}(x, y) + f_{xz}(x, z) + f_{yz}(y, z)$ .

### Definition

The functions  $f_{xy}, f_{xz}, f_{yz}$  from the proposition above are called **frame functions** of  $(3, 2)$ -function  $F$  **at the point**  $(x_0, y_0, z_0)$ .

## (3, 2)–function

### Remark

Suppose  $F = f_{xy} + f_{xz} + f_{yz}$  and  $f_{xy} \in L^1(\mu_{xy})$ ,  $f_{xz} \in L^1(\mu_{xz})$ ,  $f_{yz} \in L_1(\mu_{yz})$ . Then  $F \in L^1(\mu)$  for any uniting measure  $\mu$ .

But it's not true, that if  $F$  is a (3, 2)–function and  $F \in L^1(\mu)$  for a uniting measure  $\mu$ , then there exist  $f_{xy} \in L^1(\mu_{xy})$ ,  $f_{xz} \in L^1(\mu_{xz})$ ,  $f_{yz} \in L_1(\mu_{yz})$  such that  $F = f_{xy} + f_{xz} + f_{yz}$ .

### Definition

Measures  $\mu$  and  $\nu$  are called **uniformly equivalent** if  $L^1(\mu) = L^1(\nu) \Leftrightarrow d\mu = r d\nu$  for some bounded and separated from zero density function  $r$ .

A measure  $\mu$  on the space  $X \times Y \times Z$  is called **almost product** if there exist measures  $\nu_x, \nu_y, \nu_z$  such that  $\mu$  is uniformly equivalent to  $\nu_x \times \nu_y \times \nu_z$ .

It's easy to prove that it's sufficient to take  $Pr_X\mu, Pr_Y\mu, Pr_Z\mu$  as  $\nu_x, \nu_y, \nu_z$ .

## $(3, 2)$ -function

### Theorem

Denote by  $F$  a  $(3, 2)$ -function on the space  $X \times Y \times Z$ ,  $\mu$  is a finite uniting measure on  $X \times Y \times Z$ ; suppose that  $\mu$  is almost product. Suppose  $F \in L^1(\mu)$ ; then for almost all  $(x_0, y_0, z_0) \in X \times Y \times Z$  the frame functions  $f_{xy}, f_{xz}, f_{yz}$  are integrable with respect to  $\mu_{xy}, \mu_{xz}, \mu_{yz}$ .

### Corollary

Assume  $\mu$  and  $\nu$  are measures on the space  $X \times Y \times Z$  such that there holds

$$Pr_{XY}\mu = Pr_{XY}\nu, Pr_{XZ}\mu = Pr_{XZ}\nu, Pr_{YZ}\mu = Pr_{YZ}\nu.$$

Suppose  $\mu$  is almost product;  $F \in L^1(\mu)$  is a  $(3, 2)$ -function. Then  $F \in L^1(\nu)$  and

$$\int F d\mu = \int F d\nu$$

# Existence of a solution of the dual (3, 2)–problem

## Definition (Dual (3, 2)–problem)

Suppose  $\mu_{xy}, \mu_{xz}, \mu_{yz}$  are the measures on  $X \times Y, X \times Z, Y \times Z$ ;  $c$  is a cost function on  $X \times Y \times Z$ . Dual (3, 2)–problem is a problem of maximization

$$\int f_{xy} d\mu_{xy} + \int f_{xz} d\mu_{xz} + \int f_{yz} d\mu_{yz}$$

over (integrable) functions  $f_{xy}, f_{xz}, f_{yz}$  such that  $f_{xy}(x, y) + f_{xz}(x, z) + f_{yz}(y, z) \leq c(x, y, z)$ .

## Definition (Dual (3, 2)–problem)

Suppose  $\mu$  is a measure on  $X \times Y \times Z$  with the projections  $\mu_{xy}, \mu_{xz}, \mu_{yz}$ ;  $c$  is a cost function. Dual (3, 2)–problem is a problem of maximization  $\int F d\mu$  over (integrable) (3, 2)–functions  $F$  such that  $F \leq c$ .

This definitions are equivalent if  $\mu$  is almost product.

# Existence of a solution of the dual (3, 2)–problem

## Theorem

Assume  $\mu$  is a probability measure on  $X \times Y \times Z$  and  $c$  is a cost function such that  $c(x, y, z) \leq c_{xy}(x, y) + c_{xz}(x, z) + c_{yz}(y, z)$  for some (integrable)  $c_{xy}, c_{xz}, c_{yz} < +\infty$ . Suppose  $\mu$  is almost product. Assume that  $c$  is greater than some (3, 2)–function. Then there exist integrable with respect to  $\mu_{xy}, \mu_{xz}$  and  $\mu_{yz}$  functions  $-\infty \leq f_{xy}, f_{xz}, f_{yz} < +\infty$  such that  $F_0 = f_{xy} + f_{xz} + f_{yz} \leq c$ , and  $\sup_{F \leq c} \int F \, d\mu = \int F_0 \, d\mu$ .

## Remark

The same conditions for (n, 1)–problem were used in [Kellerer 1984]

# Existence of a solution of the dual $(3, 2)$ –problem

Without loss of generality we can assume that  $c \leq 0$ .

## Theorem (Komlos)

*Let  $(X, \mathcal{A}, \mu)$  be a finite measure space. Suppose  $\{f_n\} \subset L^1(\mu)$  and  $\sup_n \|f_n\|_{L^1(\mu)} < \infty$ . Then there exists a subsequence  $\{g_n\} \subset \{f_n\}$  and a function  $g \in L^1(\mu)$  such that for any subsequence  $\{h_n\} \subset \{g_n\}$  arithmetic means of the first  $n$  partial sums  $(h_1 + \dots + h_n)/n$  tend to  $g$  almost everywhere.*

By this theorem, there exists a sequence of  $(3, 2)$ –functions  $\{F_n\} \subset L^1(\mu)$  and  $F \in L^1(\mu)$  such that  $F_n \leq c$ ,  $\lim_{n \rightarrow \infty} \int F_n d\mu = \sup_{F \leq c} \int F d\mu$  and  $F_n$  tend to  $F$  almost everywhere.

## Existence of a solution of the dual (3, 2)–problem

All the functions  $F_n$  are bounded from above. Therefore, it follows from reverse Fatou's lemma, that  $\int F d\mu \geq \lim_{n \rightarrow \infty} \int F_n d\mu = \sup_{F \leq c} \int F d\mu$ .

### Definition

A point  $(x, y, z) \in X \times Y \times Z$  is called **regular** if  $\lim_{n \rightarrow +\infty} F_n(x, y, z) = F(x, y, z) \neq \infty$ .

For  $F$  and  $(x_0, y_0, z_0) \in X \times Y \times Z$  we define  $f_{xy}, f_{xz}, f_{yz}$  as follows:

$$f_{xy}(x, y) = \begin{cases} F(x, y, z_0) - \frac{1}{2}F(x, y_0, z_0) - \frac{1}{2}F(x_0, y, z_0) + \frac{1}{3}F(x_0, y_0, z_0) \\ \text{if } (x, y, z_0), (x, y_0, z_0), (x_0, y, z_0), (x_0, y_0, z_0) \text{ are regular,} \\ -\infty \text{ otherwise.} \end{cases}$$

$f_{yz}, f_{xz}$  are constructed in the same way.

# Existence of a solution of the dual $(3, 2)$ –problem

## Lemma

For almost all points  $(x_0, y_0, z_0) \in X \times Y \times Z$  the functions  $f_{xy}, f_{xz}, f_{yz}$  from the previous slide are so that

- $f_{xy}, f_{xz}, f_{yz}$  are integrable with respect to  $\mu_{xy}, \mu_{xz}, \mu_{yz}$ ,
- $f_{xy} + f_{xz} + f_{yz} \leq F$ ,
- $f_{xy} + f_{xz} + f_{yz} = F$  almost everywhere.

This lemma is proved by Fubini's theorem.

Then the functions  $f_{xy}, f_{xz}, f_{yz}$  are the solution of the dual problem. Q.E.D.

## Remark

The same technique works for  $(n, k)$ .

# Nonexistence of a dual solution

**Aim:** construct a measure  $\mu$  and a bounded cost function  $c$  such that there exists no «maximal»  $(3, 2)$ -function for the related dual problem. So, measure  $\mu$  will not be almost product.

Suppose  $X = Y = Z = \mathbb{N}$  are discrete measurable spaces. Assume  $p_n = \frac{1}{n^2}$ . Denote by  $A_n$  the set  $\{(n+1, n, n), (n, n+1, n), (n, n, n+1), (n, n+1, n+1), (n+1, n, n+1), (n+1, n+1, n)\}$  for any  $n \in \mathbb{N}$ . Denote by  $\mu$  the following measure on  $X \times Y \times Z$ :

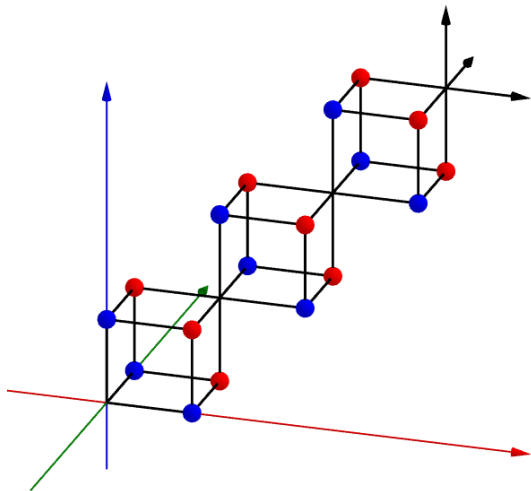

$$\mu(x, y, z) = \begin{cases} p_n & \text{if } (x, y, z) \in A_n, \\ 0 & \text{otherwise.} \end{cases}$$

Denote by  $\mu_{xy}, \mu_{xz}, \mu_{yz}$  the projections of  $\mu$ . Suppose

$$c(x, y, z) = \begin{cases} 1 & \text{if } (x, y, z) \in \{(n+1, n, n), (n, n+1, n), (n, n, n+1)\}, \\ 0 & \text{otherwise.} \end{cases}$$

is a cost function.

# Nonexistence of a dual solution

Support of  $\mu$  is the set of colored points. The cost function equals 1 on the blue points and 0 elsewhere.

# Nonexistence of a dual solution

## Lemma

*There exists a unique uniting measure  $\mu$  for  $\mu_{xy}, \mu_{xz}, \mu_{yz}$ .*

Let  $\nu$  be a measure with projections  $\mu_{xy}, \mu_{xz}, \mu_{yz}$ . Then  $\nu$  is supported on  $\{(x, y, z) \mid \max(|x - y|, |x - z|, |y - z|) \leq 1\}$ . Assume  $a_n = \nu(n, n, n)$ . It's easy to prove that

$$\nu(n+1, n, n) = \nu(n, n+1, n) = \nu(n, n, n+1) = p_n - \sum_{i=1}^n a_n$$

$$\nu(n, n+1, n+1) = \nu(n+1, n, n+1) = \nu(n+1, n+1, n) = p_n + \sum_{i=1}^n a_n$$

$p_n$  tend to 0. Therefore, if  $a_k > 0$  for some  $k$ , then there exists  $n \in \mathbb{N}$  such that

$$\nu(n+1, n, n) < 0.$$

# Nonexistence of a dual solution

In particular  $\mu$  is the primal solution of the related  $(3, 2)$ -problem. Suppose  $F$  is the dual problem solution. It follows from the complementary slackness conditions that:

$$F(n+1, n, n) = F(n, n+1, n) = F(n, n, n+1) = 1,$$

$$F(n, n+1, n+1) = F(n+1, n, n+1) = F(n+1, n+1, n) = 0.$$

It follows from the property of  $(3, 2)$ -function that  $F(n+1, n+1, n+1) - F(n, n, n) = -3$ . Since  $F(1, 1, 1) \leq 0$ , we obtain  $F(n, n, n) \leq 3 - 3n$ .

If  $F = f_{xy} + f_{xz} + f_{yz}$  then there holds

$$\int |f_{xy}| d\mu_{xy} + \int |f_{xz}| d\mu_{xz} + \int |f_{yz}| d\mu_{yz} \geq \sum_{n=1}^{+\infty} (3n - 3)p_n = +\infty$$

# Boundedness of a dual solution

## Remark

*In the classical Monge-Kantorovich problem if the cost function is bounded then there exists a bounded dual solution.*

## Theorem

*Assume  $X = Y = Z = \mathbb{N}$ ;  $\mu_x, \mu_y, \mu_z$  are probability measures on  $X, Y, Z$ . Suppose  $\mu_{xy} = \mu_x \times \mu_y, \mu_{xz} = \mu_x \times \mu_z, \mu_{yz} = \mu_y \times \mu_z$ ;  $c$  is a cost function such that  $0 \leq c \leq 1$ . Denote by  $F$  a dual solution of (3,2)-problem with projections  $\mu_{xy}, \mu_{xz}, \mu_{yz}$  and the cost function  $c$ . Then  $-12 \leq F$  almost everywhere.*

## Remark

*In the (3,2)-problem for compact metric spaces  $X, Y, Z$ , bounded  $c$  and almost product  $\mu$  primal solution is bounded.*

# Boundedness of a dual solution

Assume  $\mu = \mu_x \times \mu_y \times \mu_z$  and  $\text{opt}$  is the primal solution.  
Complementary slackness:

$$\text{opt}(x, y, z) = 0 \text{ или } F(x, y, z) = c(x, y, z).$$

## Proposition

*For arbitrary probability measure  $\nu$  there holds  $\int F d\nu \leq 1$ . If the support of  $\nu$  is a subset of the support of  $\text{opt}$  then  $\int F d\nu = \int c d\nu \geq 0$ .*

## Lemma

*For every  $z_0$  such that  $\mu_z(z_0) > 0$  there holds*

$$\int_{z=z_0} F(x, y, z_0) d\mu_x \times \mu_y \geq -1 + \int_{X \times Y \times Z} F d\mu.$$

# Boundedness of a dual solution

Consider signed  $\mu_0$ :

$$\mu_0(x, y, z) =$$

=

# Boundedness of a dual solution

Consider signed  $\mu_0$ :

$$\begin{aligned}\mu_0(x, y, z) &= \\ &= \frac{1}{\mu_z(z_0)} \text{opt}(x, y, z) \delta_{z_0}(z)\end{aligned}$$

# Boundedness of a dual solution

Consider signed  $\mu_0$ :

$$\begin{aligned}\mu_0(x, y, z) &= \\ &= \frac{1}{\mu_z(z_0)} \text{opt}(x, y, z) \delta_{z_0}(z) \\ &- \frac{1}{\mu_z(z_0)} \text{opt}(x, y, z_0) \mu_z(z)\end{aligned}$$

# Boundedness of a dual solution

Consider signed  $\mu_0$ :

$$\begin{aligned}\mu_0(x, y, z) &= \\ &= \frac{1}{\mu_z(z_0)} \text{opt}(x, y, z) \delta_{z_0}(z) \\ &- \frac{1}{\mu_z(z_0)} \text{opt}(x, y, z_0) \mu_z(z) \\ &+ \mu(x, y, z)\end{aligned}$$

# Boundedness of a dual solution

Easy to check that

$$Pr_{X \times Y} \mu_0 = \mu_x \times \mu_y,$$

$$Pr_{X \times Z} \mu_0 = \mu_x \times \delta_{z_0},$$

$$Pr_{Y \times Z} \mu_0 = \mu_y \times \delta_{z_0},$$

So projections of  $\mu_0$  coincide with those of  $\mu_x \times \mu_y \times \delta_{z_0}$ .

Then

$$\int F(x, y, z_0) d\mu_x \times \mu_y = \int F(x, y, z) d\mu_0 \geq 0 - 1 + \int F d\mu.$$

## Boundedness of a dual solution

Let  $\mu(x_0, y_0, z_0) > 0$ . Then there exist  $x_1, y_1, z_1$  such that

$$\text{opt}(x_1, y_0, z_0) > 0, \text{opt}(x_0, y_1, z_0) > 0, \text{opt}(x_0, y_0, z_1) > 0.$$

Consider

$$\begin{aligned} \mu_1 = & \delta_{x_1} \times \delta_{y_0} \times \delta_{z_0} + \delta_{x_0} \times \delta_{y_1} \times \delta_{z_0} + \delta_{x_0} \times \delta_{y_0} \times \delta_{z_1} - \\ & - (\delta_{y_0} \times \delta_{z_1} + \delta_{y_1} \times \delta_{z_0}) \times \mu_x - (\delta_{x_0} \times \delta_{z_1} + \delta_{x_1} \times \delta_{z_0}) \times \mu_y - \\ & - (\delta_{x_0} \times \delta_{y_1} + \delta_{x_1} \times \delta_{y_0}) \times \mu_z + (\delta_{x_0} + \delta_{x_1}) \times \mu_y \times \mu_z + \\ & + (\delta_{y_0} + \delta_{y_1}) \times \mu_x \times \mu_z + (\delta_{z_0} + \delta_{z_1}) \times \mu_x \times \mu_y - 2\mu_x \times \mu_y \times \mu_z \end{aligned}$$

Projections of  $\mu_1$  coincide with those of  $\delta_{x_0} \times \delta_{y_0} \times \delta_{z_0}$ . That means

$$F(x_0, y_0, z_0) = \int F d\mu_1 \geq -12 + 4 \int F d\mu.$$

### Corollary

*There exists a bounded dual solution.*

## Theorem

Assume  $X = Y = Z = [0, 1]$ ;  $\mu_{xy}, \mu_{xz}, \mu_{yz}$  are Lebesgue measures on  $[0, 1]^2$ . Suppose  $c = \max(0, x + y + 3z - 3)$  is a cost function. Then any dual solution of the related dual problem equals

$$F(x, y, z) = \begin{cases} 0 & \text{if } z \leq \frac{2}{3}, \\ x + y + 3z - 3 & \text{if } z > \frac{2}{3} \end{cases}$$

almost everywhere. In particular, there is no continuous solution for this problem.

# Discontinuous dual solution

Figure: An optimal measure for the cost function  $\max(0, x + y + 3z - 3)$
